

Contents

The individual chapters and subchapters of the interactive reader „Mechanics of Materials“ are listed here. If you have downloaded the whole set of files into the directory **dir**, all the chapters are saved in separate files, named according to the content of frame by the chapter title.

The chapter can be reached by a mouse **click** on this frame or by opening the **pdf**-file in the **dir**.

Accordingly, if there is p02 in the frame behind the title of the second chapter Limit states, you can find the appropriate part in the file dir\p02.pdf

Subchapters are saved in the same file as the main chapter and begin on the screen numbered by the number in the frame. You can reach it by a mouse **click to this frame** or by opening the **pdf**-file in the **dir** and moving to the appropriate page.

Accordingly, if there is 2 in the frame behind the title Objectives in the first chapter, you can find the appropriate part in the file dir\p01.pdf, where it begins at the page 2.

1	Mechanics of materials - introduction	p01
1.1	Objectives of the mechanics of materials	2
1.2	Relations between various branches of mechanics and courses	5
1.3	Approaches in mechanics of materials	6
1.4	Fundamental terms in mechanics of materials	7
2	Limit states	p02

2.1	Limit state of deformation	5
2.2	Limit state of elasticity	6
2.3	Limit state of buckling	7
2.4	Limit state of fracture	8
3	Element of the body and stress in a section	p03
3.1	Principle of stress evaluation	5
3.2	Overview of analytically solvable model bodies	6
4	Stress state in a point of the body	p04
4.1	Saint Venant's principle	5
5	Deformation of bodies	p05
6	Loads of the body	p06
7	Basic formulations of linear theory of elasticity	p07
7.1	Hooke's law	2
7.2	Work done by a force during body deformation	5
7.3	General principles of the linear theory of elasticity	7
7.3.1	Principle of superposition	7
7.3.2	Principle of reciprocity of works (Betti's theorem)	8
7.3.3	Deformation work of a system of isolated forces	11
7.3.4	Castigliano's theorem	13

8	Basic properties of elastic-plastic material	p08
9	Tension and compression tests	p09
9.1	Tension test of material in ductile state	1
9.1.1	Region of elastic deformations (I)	2
9.1.2	Region of homogeneous elastic-plastic deformations (II)	3
9.1.3	Region of non-homogeneous elastic-plastic deformations (III)	4
9.2	Compression test of material in ductile state	5
9.3	Tension and compression tests of material in brittle state	6
10	Simple elasticity theory of bars	p10
10.1	Bar assumptions	2
10.2	Geometrical characteristics of the cross section	6
10.2.1	Cross section area	6
10.2.2	Linear (static) moments	6
10.2.3	Quadratic moments (moments of inertia)	7
10.2.4	Basic properties of quadratic moments (moments of inertia)	8
10.2.5	Quadratic moments of basic simple cross section shapes	10
10.2.6	Quadratic moments under transformation of coordinate system	11
10.2.7	Principal quadratic moments	13
10.2.8	Mohr's representation of quadratic moments	14

10.3	Inner resultants in bars (VVÚ)	15
10.4	Evaluation of inner resultants (VVÚ)	21
10.4.1	Approaches to evaluation of distribution of inner resultants (VVÚ)	21
10.4.2	Helping rules for evaluation of distribution of inner resultants	28
10.4.3	Opened supported bars	31
10.4.4	Closed bars - frames	39
10.4.5	Algorithm of evaluation of inner resultants	40
10.5	Examples and problems	43
10.6	Examples and problems	44
11	Simple tension and compression	p11
11.1	Definition	1
11.2	Geometrical relations	2
11.3	Stress distribution in the cross section	3
11.4	Relation between component of inner resultant and stress	4
11.5	Extreme stress	5
11.6	Strain energy	6
11.7	Expression of the deformation characteristic of the centreline	8
11.8	Deformations of the cross section	9
11.9	Analysis of the stress state under simple tension	9

11.9.1	Graphical representation of stress state	12
11.10	Fields of applicability of the simple tension of bars	16
11.10.1	Influence of the cross section variability along the centreline	17
11.10.2	Influence of a screw-shaped bar	22
11.10.3	Variability of normal force along the centreline of a straight bar . .	23
11.10.4	Curvature of the bar centreline	25
11.11	Solving problems concerning simple tension (compression) of bars . . .	29
11.11.1	Free bar	29
11.11.2	Supported bar	32
11.11.3	Systems with bars loaded by simple tension (compression)	34
11.12	Examples and problems	42
12	Simple torsion	p12
12.1	Definition	1
12.2	Geometrical relations	3
12.3	Stress distribution in the cross section	5
12.4	Dependence between inner resultants and stresses	7
12.5	Extreme stress	8
12.6	Strain energy	9
12.7	Expression for deformation characteristic of bar centreline	11

12.8	Deformations of the cross section	11
12.9	Solving problems concerning simple torsion of bars	12
12.9.1	Free bar	12
12.9.2	Supported bar	15
12.10	Examples and problems	18
13	Simple flection	p13
13.1	Definition	1
13.2	Geometrical relations	2
13.3	Stress distribution throughout the cross section	3
13.4	Dependence between inner resultants and stresses	4
13.5	Extreme stresses	7
13.6	Strain energy	9
13.7	Description of centreline deformations	10
13.8	Deformation of the cross section	14
13.9	Fields of applicability of the theory of simple flection of bars	14
13.9.1	Influence of the cross section variability along the centreline	14
13.9.2	Variability of bending moment along the centreline	16
13.9.3	Beams with curved centreline	19
13.10	Solving tasks concerning simple flection of beams	20

13.10.1	Free beam	20
13.10.2	Differential approach	21
13.10.3	Integral approach	24
13.10.4	Comparison of differential and integral approaches	25
13.10.5	Supported beam	26
13.11	Examples and problems	28
14	Curved and angular open beams	p14
15	Buckling and stability	p15
15.1	Buckling of an ideal free column	2
15.2	Critical force of buckling at a supported bar	8
15.3	Compressive load of a column of a real material	9
15.4	Examples and problems	12
16	Mathematical description of stress state	p16
16.1	Principal coordinate system	1
16.2	Calculation of stresses in a general plane	3
16.3	Stresses in octahedric plane	5
16.4	Graphical representation of stress state	6
16.5	Specific types of stress states	7
16.5.1	Triaxial stress state	8

16.5.2	Biaxial (plane) stress state	9
16.5.3	Uniaxial stress state	11
16.5.4	Zero stress state	11
17	Fundamentals of theory of limit states	p17
17.1	Factor of safety	4
17.2	Limit state of elasticity	6
17.2.1	Tresca's plasticity criterion ($\max \tau$)	8
17.2.2	Mises' plasticity criterion (HMH)	12
17.3	Brittle fracture	16
17.4	General and simple factor of safety	23
18	Finite element method	p18
19	Nomograms for estimation of stress concentration factors	p19
s01	Statics - recommendation	s01
	List of examples	Examples
